N;Alternate names: growth hormone receptor
N;Contains: somatotropin receptor, short form
C;Species: allus gallus (chicken)
C;Date: 06-Jan-1995 #sequence revision 06-Jan-1995 #text_change 02-Aug-2002
C;Accession: S32823; A49812
C;Accession: S32823; A49812

DISEASE: Defects in GHR are a cause of Laron dwarfism
[MIN:262509]; also known as piruthary dwarfism II (Laron-type
pitulitary dwarfism or Laron syndrome (LS)).
DISEASE: Defects in GHR are a cause of idiopathic short stature
[MIN:600946].
SIMILARITY: Belongs to the type I cytokine family of receptors.
Subfamily 1.
SIMILARITY: Contains 1 fibronectin type III domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FUNCTION: This is a receptor for pituitary gland growth hormone SUBUNIT: Homodimer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Norstedt G.;

"Monkey growth hormone (GH) receptor gene expression. Evidence for monkey growth hormone (GH) receptor gene expression. Evidence for J. Biol. Chem. 272:18951-18958(1997).

-!- FUNCTION: This is a receptor for pituitary gland growth hormone.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- SIMILARITY: Belongs to the type I cytokine family of receptors. Subfamily 1.

-!- SIMILARITY: Contains I fibronectin type III domain.
                                                                                                                                                                                         Macaca mulatta (Rhesus macaque).

Porcine growth hormone receptor cDNA sequence.";
Nucleic Acids Res. 18:6451-6451(1990).
-!- FUNCTION: This is a receptor for pituitary gland growth hormone.
-!- SUBCELLUIAR LOCATION: Type I membrane protein.
-!- SUBCELLUIAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Belongs to the type I cytokine family of receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CYTOPLASMIC (POTENTIAL).

Nature 330:537-543(1987).
-!- FUNCTION: This a receptor for pituitary gland growth hormone.
-!- SUBUNIT: Homodimer.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SUMILARITY: Belongs to the type I cytokine family of receptors.
                                                                                                                                                           Leung D.W., Spencer S.A., Cachianes G., Hammonds R.G., Collins C., Henzel W.J., Barnard R., Waters M.J., Wood W.I., "Growth hormone receptor and serum binding protein: purification,

"The growth hormone-binding protein in rat serum is an alternatively spliced form of the rat growth hormone receptor.";
Genes Dev. 3:1199-1205(1989).
-!-FUNCTION: This is a receptor for pituitary gland growth hormone.
-!-SUBUNIT: Homodimer.
-!-SUBCELLULAR LOCATION: Type I membrane protein.
-!-SUBCELLULAR LOCATION: Type I general protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

FUNCTION: Isoform 1 is a receptor for pituitary gland growth hormone. Isoform 2 is a serum growth hormone binding protein that may play an important role in regulating the effective serum concentration of gh.
SUBUNIT: Isoform 1 is a homodimer.
SUBCELIULAR LOCATION: Type 1 membrane protein (isoform 1).
Secreted (isoform 2).
                                                                                                                                                                                                                                                                                                                                  Moffat J.G., Edens A., Talamantes F., "Structure and expression of the mouse growth hormone receptor/growth

Endocrinology 128:3183-3192(1991).
-!- FUNCTION: This is a receptor for pituitary gland growth hormone.
                                                                                                                                                                                                                                                    -!- SUBUNTT: Homodimer.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUB SPECIFICITY: Broad specificity.
-!- SIMILARITY: Belongs to the type I cytokine family of receptors.

Submitted (JAN-1996) to the EMBL/GenBank/DDBJ databases.
submitted (JAN-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This is a receptor for pituitary gland growth hormone.
-!- SUBUNIT: Homodimer (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Belongs to the type I cytokine family of receptors.
                                                                                                                                                  Columba livia (Domestic pigeon).

Structure of the gene for the arylphorin-type storage protein SP 2

of Bombyx mori.";

J. Biol. Chem. 264:11020-11025(1989).

I. FUNCTION: Larval storage protein (LSP) which may serve as a store of amino acids for synthesis of adult proteins.

I. SUBCELLULAR LOCATION: Extracellular.

I. TISSUE SPECIFICITY: Fat body.
                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SEX-SPECIFIC STORAGE-PROTEIN 2.

SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: EXPRESSED IN ADULT LUNG AND LIVER, AND IN FETAL LIVER, BRAIN, INTESTINE AND PLACENTA.
SIMILARITY: Belongs to the Tyr family of protein kinases.
CSF-1/PDGF receptor subfamily.
SIMILARITY: Contains 7 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FUNCTION: RECEPTOR FOR VEGF-C. Biotechnol. 20:1118-1123 (2002).
-!- FUNCTION: Cell wall formation (By similarity).
-!- CATALYTIC ACTIVITY: UDP-N-acetylmuramate + NADP(+) = UDP-N-acetyl-3-0-(1-carboxyvinyl)-D-glucosamine + NADPH.
-!- COFACTOR: FAD (By similarity).
-!- PATHWAY: Peptidoglycan biosynthesis.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bacteria; Proteobacteria; Gammaproteobacteria; Alteromonadales; Alteromonadaceae; Shewanella.

Controlling the availability and/or signal transduction capability of a cell surface receptor, useful for treating growth hormone deficiencies.

Claim 15; Page 27; 36pp; English.

This sequence is a cleavage signal site. This site is used in a method for controlling the availability and signal transduction capability of a cell surface receptor by administering an inhibitor that is capable of inhibiting proteolytic cleavage of the receptor. Inhibition of this proteolytic cleavage of the receptors being present on the proteolytic cleavage results in the receptors being present on the proteolytic cleavage results in the receptors being present on the the cell. This increases the sensitivity of cells to any hormones which might be present. The inhibitor is derived from or competes with an amino acid sequence around this proteolytic cleavage signal. The inhibitor may be used to treat muscle watting, associated with disorders such as renal tubular defects, uraemia, diabates, Cushing's syndrome, cachexias, eating disorders, AIDS, after stress and during neuromuscular disease

Sequence 7 AA;

active domain in hGH. The method is useful for determining the relationship between structure and function of known polypeptide sequences. The present sequence shows a mutated part of an hGH binding protein, a target polypeptide for hGH used to test the binding of substitution mutants in the method of the invention

```
The invention relates to identifying an unknown active domain in a region of known amino acid sequence in a parent polypeptide e.g. human growth hormone (hGH) which has been cloned and has a pre-identified biological activity, where the active domain interacts with a target when the parent polypeptide is in its native-folded form and the interaction is comparable for the biological activity comprising: (a) comparing the amino acid sequence of polypeptide structure in the region of known amino acid sequence of hGH with the amino acid sequence or polypeptide structure in a region of known amino acid sequence or polypeptide comparable for a nanogue by parental lactogen or portine growth convenients at least 15% homology with hGH alpha-carbon coordinates within about 2-3.5 angstroms of hGH alpha-carbon coordinates coordinates with the target is different from target interaction with hGH; (b) substituted bolypeptide; (c) contacting the segment from the analogue into DNA encoding the full length segment-substituted canalogue into DNA encoding the full length segment-substituted canalogue into DNA encoding the full length segment-substituted comparing the difference between activity of the first and second segment comparing the difference between activity of the lirst and second segment substituted polypeptides as an indication of the unknown cubstituted polypeptides as an indication of the unknown

RESULT 3 ADE82293

```
This invention describes a method for generating a novel human growth hormone (hGH) variant that binds to a target for hGH with an affinity different from affinity of wild type hGH for the target. Human growth hormone (hGH) has a positive binding activity with the target receptor. The human prolactin (hPRL), human placental lactogen (hHz) and portine growth hormone (hGH) nanlogues, however, have a greatly reduced activity with that target. Six segment-substituted growth hormones were formed by substituting selected amino acid segments of hGH with an analogues amino acid segment from the analogue. Bach of hese selected segments are different and were chosen to probe either the entire amino acid segmence of the hGH molecule or those regions which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Forming human growth hormone (hGH) variants by substitution mutation so that the variant binds to a target for hGH, e.g. hGH receptors or human prolactin receptors with affinity different from that of wild-type hGH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     expected to contain the active domains. This sequence represents a fragment of plasmid phGHz used in the generation of hGH binding protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 3; Col 31-32; 87pp; English.

```
Extracellular C-domain protein of growth hormone receptor (hGHR-CD) - is used to enhance growth hormone function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthetic gene - used for coding the amino acid sequence in the hormone-combining region of human growth hormone receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The extracellular C-domain of hGHR is used to enhance growth hormone function. Two forms, Mel130Q-238Q (AAQ66550) and GS129V-238Q (AAQ66553) are given. Primers for the isolation of extracellular hGHR-CD are given in AAQ66551-52 and AAQ66554-55
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is the same as that of the natural receptor but is encoded by a synthetic gene that has a slightly altered nucleotide sequence incorporating at least 2 new restriction sites and removing a direct repeat and a palindromic sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is that encoded by a fragment of the plasmid pBSR8-3 which is used in the construction of plasmid pAcYMhGHR. pAcYMhGHR contains a DNA fragment encoding the binding region of human growth hormone receptor (hGHR) under control of a Baculovirus gene expression system. This can be used to transform insect cells to produce a more natural protein than is obtd. with E.coli and in larger amts. See also AAR22457-R22459
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New recombinant plasmid and Baculovirus having specific DNA fragment -used for prepn. of hormone binding region protein of human growth hormone

RESULT 7 AAR05045

```
A polypeptide (AAW10426) comprises the soluble extracellular domain of human liver growth hormone receptor (somatogenic receptor, shGHr). It was expressed in Escherichia coli transformants using a vector derived from pJ1446 (AAY1449). shGHr can be used in a novel method designed for the identification of polypeptide active domains. For human growth hormone segments of hGH with analogous segments from analogue selected amino acid segments of hGH with analogous segments from analogue polypeptides (human placenta lactogen, human prolactin and pig growth hormone) and examining placents are detd., active site amino residues (see also AAW10427-62) can be similarly identified. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identification of unknown active domains in polypeptide(s) - useful for analysis of structure and function of hormones, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Growth hormone receptor; somatogenic receptor; human; pJ1446; variant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The soluble human growth hormone receptor shGHr was subcloned into pB0475 to form pJ1446. E.coli W3110, degP was transformed with pJ1446 and grown in low-phosphate emedia in a fermentor at 30 degrees C. This 246 amino acid hGHr is produced. See also AAQ04671 and AAQ04672. (Updated on 25-MAR -2003 to correct PR field.)

This is the amino acid sequence of human liver soluble somatogenic receptor, as encoded by a DNA insert of plasmid pul446 (see AAV62766). The livention provides methods for the systematic analysis of the structure and function of polypeptides by identifying active domains which influence the activity of the polypeptide with a target substance (for human growth hormone (see AAW82801, the target used was somatogenic receptor). Active domains are determined by substituting selected amino acid segments of the polypeptide with an analogous polypeptide segment, and comparing the activity of the substituted polypeptide with that of the mative polypeptide for the target. The invention also provides methods for identifying the active amino acids within the active domain. The method is particularly applied to hormones. Polypeptides can be properties than wild-type proteins, e.g. human growth hormone with increased potency but reduced diabetogenic activity and human prolactin or properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying amino acids in polypeptide(s) that are involved in interaction with target - by introducing scanning amino acid substitutions at selected positions and screening for any change in interaction, particularly to engineer hormones with altered properties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a human soluble growth hormone receptor (shGHR) encoded by plasmid pJ1446 (see AAX87977). shGHR was expressed in E. coli and was used in blinding assays of human growth hormone variants. The invention provides a method for the systematic analysis of the structure and function of polypeptides by identifying active domains which influence the activity of the polypeptide with a target substance, and method for identifying the active amino acid residues within the active domain of a polypeptide. It also provides polypeptide variants comprising segment-substituted and residue-substituted growth hormones, prolactins (see AAX11764) and placental lactogens (see AAX11765). Identifying receptor binding sites in hormones permits the rational design of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolated nucleic acids encoding variants of human prolactin and placental lactogen useful for identifying active domains within those proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes the production of a polypeptide variant (I) comprising segment substituted and residue substituted growth hormone, prolactin or placental lactogens. The method is particularly used to produce variants of growth hormone (GH), prolactin or placental lactogens, the method is particularly classed to produce variants of growth hormone (GH), prolactin or placental lactogen, but may also be applied to receptors, interferons, and colonyclation is the production of human GH variants with altered (decreased or increased) binding interaction with the somatogenic receptor, i.e. compounds useful as human GH variants and which may have higher potency for stimulating other human GH receptors, and as standards or tracers in immunoassays for human GH. This method of DNA selection identifies the biologically active residues in active domains, including those critical for interaction with different targets. The present sequence represents the soluble region of the somatogenic receptor from liver encoded by a plasmid, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recombinant production of variant polypeptides, e.g. growth hormone variants with altered receptor specificity, using cells transformed with DNA selected by scanning mutagenesis in at least one peptide domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      human growth hormone; hGH; variant; somatogenic receptor; circular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;

This invention describes a method for generating a novel human growth hormone (hGH) variant that binds to a target for hGH with an affinity different from affinity of wild type hGH for the target. Human growth hormone (hGH) has a positive binding activity with the target receptor, the somatogenic receptor. The human prolactin (hPRL), human placental lactogen (hFL) and porcine growth hormone (pGH) analogues, however, have a greatly reduced activity with that target. Six segment-substituted agreatly reduced activity with that target. Six segment-substituted growth hormones were formed by substituting selected amino acid segments of hGH with an analogous amino acid segment from the analogue. Each of these selected segments are different and were chosen to probe either the expected to contain the active domains. This sequence represents the plasmid pyll466 which contains the synthetic hGH described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; GHS1-23; human growth hormone; GH; GHR; growth hormone; receptor;

Human fusion protein GHlinkGHR.

```
The invention relates to a binding agent comprising a first part capable of binding a ligand binding domain of a receptor linked to a second part comprising a receptor binding domain, where the binding agent modulates the activity of the receptor. Also included are a nucleic acid molecule having a sequence, which encodes a binding agent comprising sequences of a paven in the specification comprising the sequences of the full length GHStopGHR SD100 construct, GHIINGGHR construct, GH, growth hormone receptor, GHIINGGHR construct, 1157 base pair PCR fragment GHIINGGHR generated by nucleotides pTrcRNSac1 and TreHindrev, or the nucleotide sequence of the Chi 1A2 chimaera, sequences binding to the nucleic acids or degenerate sequences representing them (which have receptor antagonising activity), their encoded polypeptides, a vector comprising the nucleic acids and a cell transformed/transfected with the nucleic acid or vector. The binding agent is useful for manufacturing a medicament for the treatment of acromegaly, gigantism, growth hormone (GH) deficiency, Turner's syndrome, renal failure, osteoporosis, diabetes mellitus, cancer, obesity, insulin resistance, hyperlipidaemia, (IL)-6 hypertension, anaemia, autoimmune and infectious diseases, and inflammarcry disorders including rheumatoid archritis (interleukin (IL)-6 chimaera). The present sequence represents the fusion protein agent of the invention being the Chil 1A2 conserts the fusion protein agent of the invention being the Chil 1A2 conserts the perfect of peptide linker)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New binding agent useful in producing a medicament for treating e.g. cancer, obssity, acromegaly or gigantism, comprises a first part that binds to a ligand binding domain of a receptor and a second part having receptor binding domain.
                                                                                           /label= Unknown

The invention relates to a binding agent comprising a first part capable of binding a ligand binding domain of a receptor linked to a second part comprising a receptor binding domain, where the binding agent modulates the activity of the receptor. Also included are a nucleic acid molecule having a sequence, which encodes a binding agent comprising sequences given in the specification comprising the sequences of the full length growth hormone receptor, GHlinkGHR construct, 1157 base pair PCR fragment GHlinkGHR generated by nucleotides pTrcRNSsacI and TrcHindrev, or the nucleotide sequence of the Chi 1A2 chimaera, sequences binding to the nucleic acids or degenerate sequences representing them (which have receptor antagonising activity), their encoded polypeptides, a vector comprising the nucleic acids and a cell transformed/transfected with the nucleic acid or vector. The binding agent is useful for manufacturing a medicament for the treatment of accomegaly, gigantism, growth hormone (GH) the deficiency. Turner's syndrome, renal failure, osteoporois, diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New binding agent useful in producing a medicament for treating e.g. cancer, obesity, acromegaly or gigantism, comprises a first part that binds to a ligand binding domain of a receptor and a second part having a receptor binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hypertension, anaemia, autoimmune and infectious diseases, and inflammatory disorders including rheumatoid arthritis (interleukin (IL)-6 chimaera). The present sequence represents the fusion protein agent of the invention being the GHlinKGHR construct (growth hormone/growth hormone receptor linked by a synthetic peptide linker)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Wh repair helicase [imported] - Nostoc sp. (strain PCC 7120)

C,Species: Nostoc sp. PCC 7120

A,Note: Nostoc sp. strain PCC 7120

A,Note: Nostoc sp. strain PCC 7120 is a synonym of Anabaena sp. strain PCC 7120

A,Note: Nostoc sp. strain PCC 7120 is a synonym of Anabaena sp. strain PCC 7120

C,Date: 14-Dec-2001

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- SUBUNIT: Efficient DNA binding requires dimerization with another bHLH protein. Binds DNA as an heterodimer with MAX.
-!- SUBCELLULAR LOCATION: Nuclear (Potential).
-! SIMILARITY: Contains 1 basic helix-loop-helix (bHLH) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Legouy E., DePinho R.A., Zimmerman K., Collum R., Yancopoulos G.D., Mitsock L., Kriz R., Alt F.W.; "Structure and expression of the murine L-myc gene."; EMBO J. 6:3359-3366(1987).

"Absence of mutations involving the LiM homeobox domain gene LHX9 in 46, XY gonadal agenesis and dysgenesis.";
J. Clin. Endocrinol. Metab. 86:2465-2469(2001).
--- FUNCTION: Involved in gonadal development (By similarity).
--- SUBCELLULAR LOCATION: Nuclear (Probable).
--- SIMILARITY: Contains 1 homeobox domain.
--- SIMILARITY: Contains 2 LIM zinc-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens (Human).

Proc. Natl. Acad. Sci. U.S.A. 96:2165-2170 (1999).

-!- FUNCTION: Transcriptional regulatory protein involved in the control of cell differentiation in developing lymphoid and neural cell types (By similarity).

-!- SUBCELDIULAR LOCATION: Nuclear (Probable).

-!- SIMILARITY: Contains 1 homeobox domain.

-!- SIMILARITY: Contains 2 LIM zinc-binding domains.
